SQL Retail Sales Analysis

Project Overview

This project analyzes retail sales data using SQL in MySQL Workbench. The project focuses on sales performance, profitability analysis, customer segments, and regional analysis.

Objectives

- Analyze total sales and profit
- Identify top-performing categories
- Determine profitable regions
- Analyze customer segments
- Evaluate discount trends

Key Insights

- The technology category generated the highest sales revenue.
- The West region contributed the highest overall profit.
- The consumer segment produced maximum sales.
- Some categories showed lower profitability despite strong sales.
- Discounts impacted profit margins in certain cases.

SQL Concepts Used

- SELECT
- GROUP BY

- ORDER BY
- HAVING
- Aggregate Functions
- LIMIT

Conclusion

The project successfully demonstrates SQL-based business analysis and data analytics techniques using a retail sales dataset.
